Rozenfel'd, B. A., and Yuškevič, A. P. Notes to the mathematical treatises of Omar Khayyam. Istor. Mat. Issled. 6, 113-172 (1953). (Russian)

I - F/W

These two papers are respectively Russian translations from the Arabic and commentaries to (1) Khayyam's treatise on the solution of the cubic by intersecting conics, (2) his work on the postulates of Euclid, and (3) a short tract applying the classical Archimedean method of determining the proportion of gold and silver in an alloy of the two.

For (1) the translator used the text established by Woepcke and published with the French translation of 1851 [Omar Alkhayyami, Duprat, Paris]. He remarks the translation into English by Kasir [Columbia Univ., 1931], but does not mention the more recent one of Winter and 'Arafat [J. Roy. Asiatic Soc. Bengal. Sci. 16, 27-77 (1950); MR 13, 809]. The four versions differ only in insignificant details.

The original of (2) is a work in three parts composed in 1077. The translator used the edition of T. Erani [Sirousse, Teheran, 1936, with Persian and Arabic introductions]

(S. G. A.)

(2)

OMAR KHAYYAM

based on a presumably unique Leyden manuscript. However a second copy, in the library of the Sepahsalar Mosque of Teheran, was utilized by D. E. Smith [Scripta Math. 3, 5-10 (1935)] who noted that the first part of (2) is an attempt to prove the postulate of parallels, and that it was Khayyam and not Saccheri who initiated the study of the "birectangular quadrilateral". The second and third parts of (2) [also studied by Plooij, Thesis, Univ. of Leiden, 1950; MR 15, 383] are a criticism of the euclidean definitions of ratio and proportion. As an alternative Khayyam defines both in terms of sequences obtained by application of the euclidean algorithm. Thus (2) is a welcome addition to the scanty material in European languages on medieval Islamic work in the foundations of mathematics. *SMA*

The mathematical treatises of Džemsid Gijaseddin Kaši
Istor.-Mat. Issled. 7, 9-379 (1954). (Russian) 1 - F/W

Yuskevič, A. P., and Rozenfel'd, B. A. Commentary on
the mathematical treatises of Džemsid Gijaseddin
Kaši. Istor.-Mat. Issled. 7, 380-449 (1954). (Russian)

These two works together comprise a translation into Russian and a commentary on two books written by Jamshid Ghiath al-Din al-Kashani or al-Kashi (fl. 1420) who worked in Iran and Turkistan. The publication does not give the Arabic text, but facsimiles of numerous manuscript pages have been included.

The first translation is of "The key to arithmetic" a work already extensively studied by Luckey in two publications [Math. Ann. 120, 217-274 (1948); Die Rechenkunst bei Gamsid b. Mas'ud al-Kaši . . . Deutsche Morgenländische Gesellschaft, Steiner, Wiesbaden, 1951; MR 9, 484; 13, 611]. Thus the main interest of the Russian translation lies in those sections not dealt with by Luckey. These are in large part a number of worked examples in which the newly invented decimal fractions are freely and adeptly applied. Topics touched on include the mensuration of plane figures, solids, regular and semi-regular polyhedra; layouts and area computations for

(over)

Q

Yusufkavir, P. and Sazantelid, B.A.

various arches and other architectural forms; operations with polynomials of arbitrary degrees; diophantine and inheritance problems.

On page 397 a line of characters printed upside down may prove confusing to readers not familiar with the Arabic sexagesimal numerals.

Of the many manuscripts extant (including one in the uncataloged Garrett collection at Princeton), the translator used the Leningrad and Berlin copies. No mention is made of the Tehran lithograph edition of 1889.

The second translation is of the "Treatise on the circumference", a computation yielding an approximation to 2π to ten sexagesimal places. A critical edition of this work with a German translation has recently been published [Abh. Deutsch. Akad. Wiss. Berlin. Kl. Math. Nat. 1950, no. 6 (1953); MR 14, 1051]. E. S. Kennedy.

ROZENFELD B A

✓ ★ Rozenfel'd, B. A. Neeuklidovy geometrii. [Non-Euclidean geometries.] Gosudarstv. Izdat. Tehn.-Teor. Lit., Moscow, 1955. 744 pp. 26.75 rubles.

This is a veritable encyclopedia of the algebraic-group-theoretical aspect of non-Euclidean geometry and as such extremely useful. According to the preface the book is also intended for reading through, in particular because the reviewer an impossible undertaking, in particular because the author excels in thoroughness rather than elegance. Formulae covering a quarter of a page are frequent, and there are some filling an entire page.

The book begins with an axiomatic introduction to Euclidean geometry as a finite-dimensional vector space with a positive definite inner product. It then passes to a coordinate space (x^1, \dots, x^n) with coordinate convergence as topology, but an inner product of the form

$$(x, x) = -(x^1)^2 - (x^2)^2 - \dots - (x^l)^2 + (x^{l+1})^2 + \dots + (x^n)^2,$$

which is denoted by ${}^{++(l)}R_n$, by $'R_n$ for $l=0$ and by R_n for $l=d=0$. For complex x notations like $'R_n(i)$ are used. After a brief introduction to Lie groups we find a detailed discussion (about 60 pages) of motions, in particular of the rotations and involutonic motions of $'R_n$ and $'R_n(i)$.

4
1 - F/7
3000

(over)

Chapter II first derives the trigonometry on a hypersphere in R_n , which is shown to be, topologically, the product of an R_1 and a hypersphere in R_{n-1} . Identification of diametrically opposite points of a hypersphere in R_{n+1} leads to the n -dimensional non-Euclidean geometry 1S_n ; in particular, S_n is an elliptic and 1S_n a hyperbolic space. After discussing the properties of S_n and 1S_n , the motions of 1S_n are studied in detail (about 50 pages). The chapter ends with a history of non-Euclidean geometry, which is interesting because it includes the contributions of Omar Khayam and of Nasir-ad-din at-Tusi, an Azerbaidjan mathematician of the 13th century. The author is (throughout the book) very fair in priority questions, but takes at times a militantly materialistic point of view in motivating discoveries.

Chapter III deals with the relations of non-Euclidean to projective geometry, including the symplectic spaces. The central point is an exhaustive study of projectivities. It is shown that the projective geometry of P_3 with the linear line complex as basic element becomes the geometry of 3S_3 and that the group of symplectic transformations of the three-dimensional symplectic space is isomorphic to the group of motions of 3S_3 . Chapter IV treats conformal geometry, in particular the relations between the points of ${}^{11}S_{n+1}$ and the hyperspheres of the conformal space C_n .

by means of Klein's polyspherical coordinates (a generalization of Darboux's pentaspherical coordinates). Of course, Poincaré's interpretation of non-Euclidean geometry appears in a duly general setting.

The fifth chapter deals with spinor representations of the motions of non-Euclidean spaces and contains much material which is due to the author. It contains in particular a detailed theory of alterions, i.e. real algebras A_n of rank 2^{n-1} whose base consists of a unit 1, of elements e_1, \dots, e_{n-1} and all products $e_{i_1} \dots e_{i_l}$ with $e_i e_j = -e_j e_i$ and $e_i^2 = -\varepsilon_i$, where $\varepsilon_i = \pm 1$ and l is the number of -1 's among the e_i . A complete list of the matrix algebras to which the various A_n are isomorphic is given. The spinor groups are defined as certain subgroups of alterion algebras, but their definition as well as their interpretation as groups of motions of non-Euclidean geometries are much too involved for a review. Special topics are the triality principle in seven-dimensional Euclidean spaces and their relation to the octaves (= Cayley numbers) and antioctaves.

(over)

Koz. V. 1/1, R.P.

The sixth chapter studies affine, projective, Euclidean, and non-Euclidean spaces over algebras other than the real numbers, in particular over the complex numbers, the dual numbers, the quaternions and antiquaternions, again with such a wealth of details, that they cannot even be indicated here. It concludes with a discussion of the projective plane of the octaves and antioctaves.

The last chapter reports on, rather than treats in detail, the relations of the foregoing material to Riemannian geometry, first on the spaces of constant curvature, and then on the geometry of simple Lie groups and their relations to symmetric spaces.

H. Busemann.

AUTHOR ROZENFEL'D B.A.
TITLE Aleksander Petrovič KOTEL'NIKOV.
PERIODICAL Istoriko-mat. Issledovanija 9, 317-400 (1956)
reviewed 2/1957

Aleksander Petrovič Kotel'nikov lived from 1865 to 1944. In Kazan he was born as a son of the known professor of mathematics and mechanics Pet. Ivanovič Kotel'nikov (1809-1879). The younger Kotel'nikov studied in Kazan and he worked in Kiew and then again in Kazan and again in Kiew as professor of mathematics and mechanics. From 1924 until his death he was professor of higher mechanics in Moscow. His small literature contains greater lectures, especially on analytic geometry, theory of screws, non-Euclidean geometry and mechanics. After an extended bibliography in the present paper in text-book-like detail the author represents the domains treated by Kotel'nikov with predilection (with historical documents). These are chiefly the Ball's theory of screws and the application of the different kinds of quaternions in geometry and mechanics. Finally the pupils of Kotel'nikov are mentioned too. The most important of them was the tensor analytician Peter Alex. Širokov (1895-1944).

Rozenfel'd, B. A.; and Levinov, A. M. Application of non-Euclidean geometry to certain problems of projective geometry. Trudy Bim Vektor Tenzor Anal 10 (1954) (Russian)

As is well known the first theorems of projective geometry were obtained by considering those properties of Euclidean geometry which remain invariant under central projection. Afterwards non-euclidean geometry was shown to be a special interpretation of projective geometry with respect to an absolute quadric. In the present paper the authors derive a series of theorems on projective geometry starting from the fact that a quadric

$$(x_1^2 + x_2^2 + x_3^2 + x_4^2) = 0$$

can be considered as the locus of points having the same distance to two mutually complete polar primes, when $x_4^2 = 0$ is the absolute quadric.

Rozenfel'd, B. A. Geometrical interpretation of compact simple Lie groups of class E. Dokl. Akad. Nauk SSSR (N.S.) 106 (1955) 600-603. (Russian)

The author announces a geometrical interpretation of the compact exceptional Lie groups E_6, E_7, E_8 . To this end the author constructs "elliptic planes" over the algebras $K \otimes O, Q \otimes O, O \otimes O$, where, K, Q, O denote the algebras of complex numbers, quaternions, Cayley numbers. The main result is that E_6, E_7, E_8 may be interpreted as groups of motions of the elliptic planes over $K \otimes O, Q \otimes O$ and $O \otimes O$. W. T. van Est (Utrecht).

TITLE: Influence of a strong magnetic field on the directional distribution of photons from two-quantum annihilation in titanium

SOURCE: Nucleonika, v. 9, no. 6, 1964, 427-437

TOPIC TAGS: positron electron annihilation, positronium atom, two quantum annihilation, two photon annihilation, two photon annihilation radiation

ABSTRACT: The directional distribution of gamma radiation resulting from two-photon positron annihilation in titanium was investigated with and without an external 22-kgs magnetic field. Comparison of distribution curves shows that in the presence of a magnetic field the rate of two-photon annihilations increases in the region of small angular deflections of quanta from collinearity, which produces a "narrow component." Under the assumption that the narrow component arises from the annihilation of singlet positronium, the

Card 1/2

ACCESSION NR: AP4045473

relative increase of two-photon events in the region of small angles can be interpreted as an increase of the amount of parapositronium brought about by the magnetically induced ortho-para conversion. The momentum of the system arising from the ortho-para conversion appears to be smaller than the momentum of the remaining pairs of the singlet state. The mean energy at the time of annihilation of nonconversion parapositronium is not greater than 0.3 ev, which corresponds to angles of about ± 1 mrad in the directional distribution. The relative increase of two-photon annihilation in a magnetic field can be regarded as evidence that the bound electron-positron system, positronium, is formed in titanium. Orig. art. has: 6 figures and 10 formulas.

Trudy, t. 8 (Transactions of the Moscow Mathematical Society, Vol 8) Moscow, Fizmatgiz, 1959. 518 p. Errata slip inserted. 2,050 copies printed.

Ed.: A.F. Lapko; Tech. Ed.: S.S. Gavrilov; Editorial Board: P.S. Aleksandrov, I.M. Gel'fand, and O.N. Golovin.

PURPOSE: This book is intended for mathematicians and theoretical physicists.

COVERAGE: This book contains a collection of articles by leading Soviet mathematicians on problems in pure and applied mathematics. All articles were written in 1957 and 1958. Among the topics discussed are: analytic - operator functions, function spaces, nonstationary plane flow of a viscous non-compressible liquid, root spaces, products of groups representations, ordinary and partial differential equations, 3rd and 4th order linear equations, homogeneous spaces, spectral theory of operators, and generalized random processes. References accompany each article.

Moscow, Universitet. Mashinostroitel'skiy institut matematiki
Trudy seminarov i teoreticheskoy matematiki i fiziki prikladnoy i
geometrii, sbornik i filii, 77, 8 (Transactions of the Seminar on
Vector and Tensor Analysis and Their Applications to Geometry, Mechanics,
and Physics, Br 8) Moscow, Gostekhnizdat, 1950. 409 p. 1,500 copies
printed.

Ed. (title page): V.F. Egan, Professor; Ed. (inside book): I.M.
Yaglom; Tech. Ed.: E.Ya. Muravova.

PURPOSE: This book is intended for professional mathematicians, especially
geometricians, and for physicists.

CONTENTS: This book contains some contributions to geometry presented by various
leading Soviet mathematicians at the Seminar on Vector and Tensor Analysis, held
from January 1, 1948, to July 1, 1949. Applications to physics and mechanics are
not discussed in detail. However, such articles is significant for its possible
applications to physics, especially the three articles by V. V. Vagner. In his

Card 1/5

articles, "The Theory of a Complex Manifold," Vagner constructs a general theory
of subjects, which turns out to be a generalization of Riemannian analysis, and de-
termines the operation of the absolute total differentiation, which is important
to the application of variational calculus, for the field of any local differ-
ential object. In his second article, "The Geometry of a Space with a Hyper-
Metric as the Theory of a Field of Local Hyper-surfaces in a Complex Manifold,"
Vagner gives the construction of geometry of a space with hypermetric metric in
such a manner that its immediate application to the geometric interpretation of
the corresponding variational problems is possible. In his third article, "Theory
of a Field of Local Hyperstrips in an n-dimensional central affine space as well as
the theory of a field of local regular n - 1 dimensional hyperstrips in \mathbb{R}_n
and the application of this theory to rigid mechanical systems with nonlinear
connections. The following persons submitted reports to the Seminar which are
not contained in the book: A. P. Rodan, V.F. Egan, D.I. Pribl, E. E. Vasendy,

AUTHOR: Rozenfel'd, B.A.

SOV/42-13-6-2/33

TITLE: ~~Rectangular~~ Matrices and Non-Euclidean Geometries
(Pryamougol'nyye matritsy i neyevklidovy geometrii)

PERIODICAL: Uspekhi matematicheskikh nauk, 1958, Vol 13, Nr 6, pp 21-48 (USSR)

ABSTRACT: The paper contains a systematic representation of the application of rectangular matrices and their broken-linear transformations in the projective and non-Euclidean geometry. The advantage of this method consists in the possibility of an intuitive geometric interpretation. The method was used already in papers of Siegel, Hua Lu -keng and Grayev. The present paper was written at the suggestion of I.M.Gel'fand. No new results are given. There are 18 references, 7 of which are Soviet, 6 American, 3 German, 1 Italian, and 1 English.

TITLE: Investigation of the refrigeration equipment of the refri-
gerator ship, "Aktyubinsk". (Ispytaniye kholodil'nogo
oborudovaniya refrizheratornogo sudna "Aktyubinsk").

PERIODICAL: "Kholodil'naya Tekhnika" (Refrigeration Engineering),
1957, No.2, pp.6 - 10 (USSR).

ABSTRACT: The results are described of tests of a refrigerated
Diesel-electric ship, carried out by the Chair of Refrigera-
tion Machinery of the Leningrad Technological Institute in
cooperation with the team of a Baltic plant. The refrig-
eration machinery was designed by the Central Refrigeration
Machinery Design Office and manufactured by the Moscow
"Compressor" Works. The "Aktyubinsk" has a displacement of
10 250 tons and is one of a larger series of refrigerator
vessels. It has 5 refrigerated holds and 5 refrigerated
'tween decks of a useful volume of 6700 m³, enabling trans-
portation of 2700 tons of frozen or 3350 tons of chilled
fish. The refrigerated holds and 'tween decks are subdivi-
ded into a fore and an aft group, each of which can operate
at differing temperatures. The cooling of the holds and
the 'tween decks is effected by a solution of calcium
chloride. In single stage operation a temperature of -6 C

Card 1/3

Investigation of the refrigeration equipment of the refrigerator ship, "Aktyubinsk". (Cont.) 66-2-2/22

can be maintained in the holds and in the 'tween decks whilst in 2-stage operation a temperature of -18 C can be maintained so that it is possible to maintain a temperature of -6 C in one group of chambers and 'tween decks and a temperature of -18 C in the other group'. The characteristics of the refrigeration machinery were established at the test stand of the "Compressor" works and have been described in an earlier paper (1). The results of the tests of the refrigerator ship are discussed and summarised in 2 tables. During the tests the entire refrigeration equipment operated satisfactorily, the insulation of the refrigerated holds and 'tween decks is of good quality and operated satisfactorily. The adopted 2-stage system is very simple in operation but the author considers it advisable to develop a circuit with an intermediate steam extraction applicable for marine use and to compare the respective technical and economic indices. To gain a clearer picture on the correct selection of the type of refrigeration machinery the applied 2-stage set MXM-ADC-150 should be compared with a high r.p.m. multi cylinder compressor, both stages being in a single unit. For marine conditions it may be of interest

Card 2/3

Investigation of the refrigeration equipment of the refrigerator ship, "Aktyubinsk". (Cont.) 66-2-2/22

to use a rotational compressor as a booster compressor of the lower stage. A number of slight inadequacies revealed during the tests should be eliminated and further control and metering instruments should be installed.

There are 3 figures, 2 tables and 1 Slavic reference.

3968. Rozenfel'd D.I. and Petrova A. N. Transformation of muscle phosphorylas b into phosphorylas a Doklady Akad. Nauk S.S.S.R. 1950, 74 (545-547)

Transformation of phosphorylas b into a occurs in alkaline medium; thus autolysed muscle extracts containing phosphorylas b, activated by adenylic acid, upon adjustment of pH to 8.5-8.7 reveal properties of a form which is activated by cysteine. The effect was very pronounced after 22 days' storage in a refrigerator, when almost all b activity was transformed into a activity.

Condensation of 2,2-dimethyldivinyl ketone with diene hydrocarbons. I. A. A. Petrov and E. B. Rozenfel'd (Tashkent Aviation Inst., Tashkent). *J. Gen. Chem. (U.S.S.R.)* 16, 1401-4(1940)(in Russian).--On heating 15 g. 2,2-dimethyldivinyl ketone (I) with 12 g. $\text{CH}_2=\text{CH}-\text{CH}=\text{CH}_2$ in the presence of 0.1 g. hydroquinone in a sealed tube at 110-115° 10 hrs., 15.5 g. (70%) condensation product (II), $\text{C}_{11}\text{H}_{16}\text{O}$, was obtained as a colorless liquid, b_p 125°, d_4^{20} 0.8492, n_D^{20} 1.5022, insol. in water; 3.3 g. in 10 ml. water, oxidized at 5-10° with 15 g. KMnO_4 and distil., yielded 0.8 g. (60%) Me_2CO . II is therefore 2,2-dimethyl-3-cyclohexenyl ketone, and it follows that condensation does not occur at the $-\text{CH}=\text{CMe}_2$ link. In the absence of hydroquinone, a considerable amt. of polymers is formed. Heating 5 g. I under the same conditions with the equiv. amt. of piperylene, $\text{CH}_2=\text{CHCH}=\text{CHMe}$, gave 4.5 g. (90%) of a condensation product, $\text{C}_{11}\text{H}_{16}\text{O}$, b_p 120-30.5°, d_4^{20} 0.9397, n_D^{20} 1.4990, also yielding Me_2CO on oxidation with KMnO_4 ; by reason of the stronger negativity of the 5th C atom of piperylene, as compared with the 2nd, the product is considered to be the 2-methyl-3-cyclohexenyl analog of II. Heating I with 15 g. of a fraction contg. 78% $\text{MeCH}=\text{CHCH}=\text{CHMe}$ gave 11.5 g. (70%) of the 2,5-dimethyl-3-cyclohexenyl analog of II, $\text{C}_{11}\text{H}_{16}\text{O}$, b_p 130°, d_4^{20} 0.9381, n_D^{20} 1.5002. N. Thon
